

# Business Case

---

## Problem Statement

Finova Digital finance, a fictional Fintech company that processes more than 50,000 loan applications. The applications are received digitally, but some of the activities around document validation, exception, SLA monitoring and customer communications are handled manually.

## What manual process is costing today

- 30% of the applications are delayed due to incomplete information that is not caught under manual review.
- Processing timelines are not monitored against any SLA so delays are identified reactively, not proactively
- No centralized ownership model for flagged exceptions - resolution time is inconsistent and untracked

## Proposed solution

Design and validate a digital loan application and exception-management solution that improves application completeness, exception ownership, SLA visibility, and customer status transparency

## Expected benefit

- Reduce average processing time from 5 business days to 2 business days by removing manual follow-up and tracking bottlenecks downstream of application submission.
- Cut applications requiring manual follow-up for missing/incomplete information from 30% to under 10%.
- Reduce customer status-check inquiries from 15 per 100 applications to under 5, by providing real-time application status visibility.

## Recommendation

Approve funding to design and build the digital loan application and exception management solution, piloted towards Personal Loans before extending to other product lines. Personal loans provide the highest application volume and simplest documentation requirements, allowing the SLA and exception-visibility improvements to be validated quickly and with lower risk before scaling to more complex, collateral-linked products. Without this investment, Finova will continue to rely on manual tracking that scales poorly with application volume, increasing both processing delays and the risk of inconsistent exception handling as the business grows.
