

Elicitation Notes

Digital Loan Application & Exception Management - FinNova Digital

Field	Details
Prepared By	Carol Felix
Sessions	4 stakeholder interviews, 1 follow up resolution call.
Period	Week 4- 6 (Stakeholder Analysis Phase)

Session 1 - Operation Manager

50 min, video call. Focus: Exception Workflow and SLA design.

Q1. Walk me through what happens today when an application comes in incomplete.

Someone on the team notices it during the review, there is no automatic check. They email or slack the customers , then they just sit in their personal tracker until they remember to follow up. If that person is out, it can sit for days.

Q2. Do you have a current average processing time you'd consider a baseline?

Around 48 h on paper, but admitted it is not tracked systematically, “if you asked me for a report on that today I’d have to pull it manually from three different trackers”. Confirmed 48h is a working estimate not a measured baseline

Q3. What SLA threshold would you consider acceptable for flagging an application as at-risk?

24 h from submission to first action. Wants an automatic alert not a dashboard someone has to remember to check.

Q4. Should exceptions be auto-assigned, or should your team pick them up manually?

Strongly wants an auto - assignment based on workload, right now two people grab the easy ones and the hard ones sit .

Q5. What would make this project a failure in your eyes?

If we still need a separate spreadsheet to track anything. The whole point is one place.

Session 2 — Credit Analyst

40 min, in-person. Focus: exception judgment and thresholds.

Q1. What counts as an "exception" from your side?

Named a few - missing documents, mismatched applicant details but was vague on edge cases - “honestly some of it is judgemental, I could n’t give you a clean rule for all of it”. Flagged a s an open item to define more precisely

Q2. How much of the queue do you think could be safely automated vs. needs a human?

Estimated “ maybe half” could be safely automated but was clearly not comfortable sharing a number - “I don’t want to promise 50% and then it turns out to be 20%. Kept as a rough estimate not a target.

Q3. Operations wants auto-assignment of exceptions by workload. Any concerns?

Pushed back - wants to self select which exceptions to pick up , arguing workload - based auto assignment could handle complex cases to someone without the right context. This directly conflicts with the Operation Manager’s session 1, Q4. Not resolved in this session escalated for followup.

Q4. What's the minimum information you need visible on an application to make a decision?

Answered quickly and specifically - application details, document completeness status, and prior exception history if any.

Session 3 — Compliance

35 min, in-person

Q1. What's the minimum audit trail requirement for exception handling?

Every exception needs an assigned owner, a timestamp and a resolution reason - “ownership without a reason isn’t accountability , it is just a name on a ticket

Q2. Any concerns about the customer notification approach?

Wanted to confirm notification wouldn’t disclose specific rejections reasons that could create regulatory exposure , asked to review notification templates before go-live rather than approving the concept blind. Treated as a signoff checkpoint, not a blocking issue now

Session 4 — Product Manager

45 min, video call. Focus: customer-facing scope and priorities.

Q1. What do customers complain about most today?

Not knowing where their applications stand. Support gets a lot of “just checking in” messages that are really just anxiety, not new information.

Q2. Should customers see exactly why an application is flagged, or just that it needs attention?

Wants specificity - “just checking in” tickets go up when the message is vague. This may be at odds with the Compliance session 3, Q2. Flagged as an open item.

Q3. How do you want to prioritize the four capability areas — tracking, SLA, documents, exceptions?

Ranked tracking and document completeness above SLA and exception routing,”customers feel tracking and missing docs immediately, they don’t see the SLA math”. Useful information for Prioritization/ MoSCoW exercise not a resolved decision.

Q4. Any features you'd explicitly want kept out of the pilot?

Confirmed no interest in customer facing exception details beyond status, for now. Wants to start simple and expand post-pilot based on what Support actually reports.

Open Items From Elicitation

- Auto assignment of exceptions by workload (Operation Manager) vs self -selection by analyst(Credit Analyst), unresolved escalated for joint session.
 - Precise exception type taxonomy - Credit Analyst could not fully define edge cases; needs a follow -up working sessions before Business Rules Document can be finalized.
 - Notification specificity; Product Manager wants detailed reasons shown to customers; Compliance wants review before anything goes out. Needs a joint session.
 - No systematic baseline exists for the 48h processing time figure - treated as a working estimate, to be validated against historical samples if available.
-

Resolution Note (Added Week 6)

Joint session held between Operation Manager and Credit Analyst. Outcome - exceptions are auto assigned by default (Operation Manager's point) but a Credit Analyst can manually reassign a case to themselves within the first 2hrs if they judge it needs specific context, neither had proposed individually. This can be reflected as a business rule in the Business Rules Document. The notification specificity idea (Product Manager vs Compliance) remains open and carried forward to the Business Rules/ FRD phase.
