

ID	PainPoints	Impact	Root Cause	Evidence		
P-01	Missing information isn't caught until manual review, well after submission	Avoidable delay between submission and first action; inconsistent customer experience	No automated completeness check exists at the point of submission - validation depends entirely on reviewers's noticing	Operation Manager Session 1 Q1; AS-IS Process Step 2		Most of these pain points trace back to a single structural gap: there is no shared, system-of-record data model for an application's state.
P-02	Follow-up requests for missing documents are informal and untracked	Requests gets missed or forgotten if the reviewer is unavailable; no visibility into how long a request has been outstanding	No structured request/ reminder workflow - followup is an individual action via email or slack, not a system tracked event.	Operation Manager Session 1 Q1; AS-IS Process Step 3		
P-03	Applications are tracked across fragmented personal/teams spreadsheet	Applications can stall invisibly; no one has a single view of where thing stand	No centralized application tracking system; each team member maintains their own tracker	Operation Manager Session1 Q1, Q5; AS-IS Process Step 4		
P-04	No verified SLA baseline exists - the 48h average is an estimate not a measurable data	The organization cannot reliably tell whether it is improving and can't prioritize fixes against real bottleneck	Processing time data lives across three separate trackers with no consolidated reporting	Operation Manager Session 1, Q2; AS-IS Step 9		
P-05	No defined taxonomy for what quantifies as an "exception" beyond missing document	Inconsistent handling - two analysts could categories the same issue differently	Exception judgement has historically been informal and person -dependedent; never condified in rules	Credit Analyst Session 2 Q1; AS-IS Process Step 5		
P-06	Exceptions are picked up unevenly the same two analysts take the "easy" cases	Harder cases sit unresolved longer, creating inconsistent turnaroud by case difficulty, not just by the team workload	No auto assignment mechanism; exceptions are self selected from a shared queue with no routing logic	Operation Manager Sessions 1 Q4; AS-IS Process Step 6		
P-07	Exception ownership and resolution reasoning are inconsistently documented	Audit exposure - no reliable way to demonstrate why a decision was made	No mandatory field or system enforcement requiring a documented reason at resolution	Compliance Session 3, Q1; AS-IS Process Step 7		
P-08	Customers have no visibility into application status at any stage	Drives repeated "just checking in" inquiries, adding more load to Support with no new information exchanged	No customer-facing status channel exists between submission and final decision	Product Manager, Session 4, Q1; AS - IS Processs Step 8
