

Functional Requirements Document

Digital Loan Application & Exception Management

Fields	Details
Document Owner	Carol Felix, Business Analyst
Version	1.0
Organization	FinNova Digital Finance

This FRD is the "how exactly does the system do that" layer beneath the BRD. Each FR maps to one BR.

Pillar 1: Application Tracking

FR-01 - Automated Completeness Check (from BR-01)

Screen: Application Submission

- Trigger : Fires immediately on submit, before the application is accepted into the queue
- Validation: Checks all mandatory fields populated and all required document types uploaded (per product specific checklist for Personal Loans)
- Error Handling: If incomplete, application is not rejected outright - it's accepted but flagged "incomplete" and routed to FR-07(auto generated request) rather than silently failing.

FR - 02 -: Centralized Application Record (from BR-02)

Screen : Operations Dashboard - Application List View

- Every application has one authoritative record (status, stage, owner, timestamp) that all internal views read from - no team maintains a separate copy.
- Validation: Only one "current status" value can exist per application at a time (prevents the fragmented tracker problem from the AS-IS).
- Error handling: If two actions attempt to update status simultaneously, system applies last -write-wins with a logged conflict flag for Operations Manager review.

FR-03 - Customer Status Visibility (from BR-03)

Screen: Customer -facing Status Page

- Trigger: Updates in real time whenever the underlying application record changes.
 - Content: Status shown as one of: Submitted, Under Review, Additional Info Needed, Exception Under Review, Approved, Rejected.
 - Error handling: If a sync fails for a status update, the customer interface displays "Last updated: [timestamp]" to clearly signal that the information might be outdated instead of hiding the issue.
-

Pillar 2 : SLA Tracking

FR-04: Per-Stage SLA Timer (from BR-04)

Trigger: A timer starts automatically when an application enters each stage (Review, Document Collection, Exception Resolution) and stops when it exits that stage.

- Each stage's elapsed time is stored individually, not just total processing time; this is what makes reporting possible without manual reconstruction (unlike AS-IS's 48h estimate).

FR-05: At-Risk SLA Alerts (from BR-05)

Trigger: Fires when a stage timer reaches 80% of its threshold and again at breach.

- Alert routes to the stage owner and, on breach, escalates to Operations Manager.
- Error handling: If no owner is currently assigned when a breach fires, alert routes to Operations Manager directly rather than being dropped.

FR-06: SLA Dashboard(from BR-06)

Screen: Operations Manager Dashboard.

- Displays: applications by stage, time-in-stage, breach count, filterable by date range.
 - Refresh: Every 15 minutes.
-

Pillar 3: Document Management

FR-07: Auto Generated Tracked Request(from BR-07)

Trigger: Fires when FR-01 flags an application "Incomplete".

- The system generates a specific, itemized request (e.g., "Upload: Proof of Address") rather than a generic "documents missing" message directly addressing the vagueness problem noted in AS-IS Step 3.
- Request is logged with a timestamp and appears on both the Operations record and customer status page.

FR-08: Reminder Schedule (from BR-08)

Trigger: If the outstanding request is unsolved, reminders are sent on fixed schedule(e.g 24h,73h after initial request)

- Error handling: Reminder schedule pauses automatically once the customer uploads the requested item, to avoid sending a reminder for something already resolved.

FR-09: Overdue Escalation (from BR-09)

Trigger: Fires if a document request remains unresolved past a defined threshold(e.g 120h/5days)

- Escalates to Operations for manual outreach; this is the fallback for cases the automated reminder cycle doesn't resolve.
-

Pillar 4: Exception Management

FR-10: Exception Classification(from BR-10)

Trigger: Fires when an application is flagged as an exception (criteria defined in the Business Rules Document).

- The system assigns an exception category and severity based on the rule set.
- Error handling: If an application matches no defined rule but was still manually flagged by a reviewer, it's categorized "Uncategorized Manual Review" rather than forced into an incorrect category.

FR-11: Auto Assignment with Override Window(from BR-11)

Trigger: Fires immediately after FR-10 classification.

- Assigns to the analyst with the lowest current open-case count (workload-based).
- Validation: Any analyst may reassign the case to themselves within 2 hours of auto-assignment (reflects the Week 6 elicitation resolution) , after 2 hours, reassignment requires Operations Manager approval.

FR-12: Mandatory Audit Trail on Resolution (from BR-12)

Screen: Exception Resolution panel

- Validation: Reason field is mandatory, minimum 10 characters, cannot be whitespace-only.
- On save: Owner ID, timestamp, and reason are written to an append-only log, no edit or delete permitted on existing entries, ever.

FR-13: Compliance Reviewed Notification Content (from BR-13)

Screen: Notification Template Configuration (admin-only, Compliance access).

- All customer-facing exception notification templates require Compliance sign-off before activation, enforced as a publish-gate, not just a process guideline.
- Until sign-off is complete, exception-related customer notifications default to a generic "Your application requires additional review" message rather than blocking notifications entirely.
